

Equipment maintenance terms

SYNTHETIC HOLDOUT FIXTURE - fictional terms for software evaluation only; not a real agreement or legal advice.

Service scope and response

1. Covered equipment

Example Operator engages Example Maintainer to service the laboratory pumps listed in Schedule M. The Support Window is 09:00 to 17:00, Monday to Friday, excluding stated public holidays. This agreement does not cover the building ventilation system or devices that are not listed by serial number. The parties will record each accepted service ticket against a listed device.

2. Base response target

The base response target for a Critical outage is eight business hours after a complete ticket is accepted during the Support Window. Critical means that a listed device cannot perform its primary function; a degraded display or nonessential sensor alone is not Critical. A response means that a technician contacts the operator and starts diagnosis, not that the repair is complete. A ticket received outside the Support Window is accepted at the next opening of that window.

3. Access dependency

Example Operator must provide safe access, a named site contact and the error record reasonably available for the affected device. If access is refused or the error record is not supplied, the response clock pauses after Example Maintainer asks for the missing item and resumes when it is provided. This dependency does not remove the duty to respond once the complete ticket is accepted.

Parts, planned work and records

4. Replacement parts

Replacement parts costing up to GBP 400 per incident are included in the monthly service charge. A part above GBP 400 requires Example Operator's written approval of a separate quote before installation. Labour for an approved replacement remains within the monthly charge unless the quote expressly identifies an additional specialist visit. Emergency status alone is not approval to exceed the parts allowance.

5. Planned interruption

Example Maintainer may schedule preventive work during the Support Window after giving two business days' notice. A planned interruption stated in that notice is not a Critical outage unless the listed device remains unavailable after the agreed work period. The parties must agree a new period if preventive work would interrupt a previously booked experiment.

6. Service records

A written visit record must identify the device, symptom, work performed and any part installed. Example Operator may request a copy within thirty days after the visit. The record is operational evidence; it is not an acceptance certificate or a change to the response target. Example Maintainer will retain the records for twelve months after this service term ends.

Schedule M - listed pumps amendment

M1. Narrow accelerated response

For the Listed Pumps only, the response target becomes four business hours from 1 June 2026, provided a complete Critical ticket is accepted during the Support Window. The Listed Pumps are serials LP-101 and LP-102; the four-hour target does not apply to other pumps, weekends, public holidays, or ticket time before the next Support Window begins. This Schedule changes clause 2's response target for those two pumps but does not promise a completed repair within four hours.

M2. Parts and escalation unchanged

The GBP 400 included-parts allowance in clause 4 continues for the Listed Pumps. An above-allowance replacement still requires Example Operator's written approval before installation. If diagnosis cannot begin because access or the error record is missing, the pause and resume rule in clause 3 continues to apply. Escalation to a senior technician after four hours is a reporting step, not an extra response period.

M3. Order of terms

Schedule M overrides clause 2 only to the extent of the narrower response target stated in M1. All other service terms remain in effect. No text here adds a support obligation for an unlisted device. The amendment begins on 1 June 2026 and does not apply retroactively to earlier accepted tickets.
